

Wordware UI Updates

Module:1

Video: 5: Build your first AI agent.

1. **Creating Project:** When you click on “Create Project,” you will notice the tools section is no longer visible on the left-hand side of the pop-up. Only the right side of the pop-up will be displayed, where you can enter the name of your project and configure its privacy settings.

Module: 2

Lesson 2: Working with a prebuilt template.

1. **Changing Input Type:** When switching the input type from "text" to "image," a change is observed. Rather than selecting directly from the right-side panel, go to the "text" dropdown and select "image" from the list.

OLD	NEW
Input type Configure the input type TEXT LONG TEXT IMAGE FILE AUDIO	Input Docs Text Number True/False ✓ Image Audio PDF / Document file CSV / Text file List Object Select Image

2. **Deleting Loop and Input:** When deleting the “if else” loop and the “Applicant Cover letter input,” note that the “delete” button is now located at the corner of the right-side panel instead of at the center.

Input

Delete

Lesson 2: We have a tool for you.

1. **Selecting Tool:** After checking the Google search tool, do not head to the homepage. Stay within the Google search tool. Click on “Make your Version.” Rename the project to “Service Locator” at the top.
2. **Adding Flow:** Within the left-side panel, click on “Add flow.” Follow the video steps from here.
3. **Adding Inputs:** To add “Service” and “Location” as inputs, type @service and click at the end of the word. A small pop-up will appear. Click on +Service to establish this input. Follow the same approach when adding “Location” as input.

You are a Service Locator Agent. Your task is to list down companies providing a particular service in a given location. Based on the name of the @Service and the location where that service is required, write asuitable Google query to search for the companies providing that service

+ Service

You are a Service Locator Agent. Your task is to list down companies providing a particular service in a given location. Based on the name of the @Service and the @location where that service is required, write asuitable Google query to search for the companies providing that service in that location

+ location

4. **Selecting LLM:** If you cannot find the LLM used in the video from the Wordware list, select a similar LLM for your task.
5. **Entering Query for Google Search:** After adding a new flow and selecting “Google Search,” enter the query in the left-side panel. Type @ in the query box, and instead of selecting “Find_the_service.Query,” click on “query” under the class “Find_my_service.”

OLD	NEW
-----	-----

6. **Adding Output:** To integrate the output of the Google search, type @, click on the arrow at the end of “Google Search,” and select “Outputs.”

This way you integrate the output of the LLM within your flow.

Lesson 3: Customizing Agents

1. **Deleting Inputs:** When deleting the prompt in the “Summarization and Knowledge check” flow, also delete the “material” input from the input panel to avoid unnecessary inputs.

2. **Establishing Inputs:** For inputs, initially, you would get a small pop-up. Now, type @<inputname> and click at the end to trigger a pop-up below. Click on +<inputname> to incorporate the input.

OLD:

You are a researcher agent. Your task is to research a topic, generate a structured 100 word summary of the same, and based on it create questions and answers on that topic. Your topic of research is @research_topic

The summary should be approximately five times smaller f AB New: research_topic w the structure:

- Description: Description of the subject explored in the text.
- Key Arguments: Key arguments and examples related to them (if any).
- Conclusion: Conclusion with the final point from the author.

NEW:

You are a researcher agent. Your task is to research a topic, generate a structured 100-word summary of the same, and based on it create questions and answers on that topic. Your topic of research is @research_topic

- Description: Description of the subject explored in the text + research_topic
- Key Arguments: Key arguments and examples related to them (if any).
- Conclusion: Conclusion with the final point from the author.

Lesson 3: Building a Resume Reviewer Agent

1. **Initial Change:** The first pop-up while creating your project.

The screenshot shows a 'Create a project' dialog box. At the top, there's a title 'Create a project' with a close button (X). Below it is a 'Name' field containing 'Resume Reviewer Agent'. Underneath is a 'Privacy' section with two options: 'Public' (with a globe icon and description 'Anyone can view and fork this project') and 'Private' (with a lock icon and description 'Only users within your organization can view and fork this project'). The 'Private' option is selected with a radio button. At the bottom, there are two buttons: 'Cancel' and 'Create project' with a right-pointing arrow.

2. **Adding PDF Input for CV:** When adding a CV as the PDF input, type /select “input.” In the right-side panel that opens, change the input name to “CV,” select “pdf” from the dropdown, and confirm.

The screenshot is split into two parts. The left part shows the 'Resume Reviewer' agent interface. It has a title 'Resume Reviewer' and an 'INPUTS' section with a 'CV' input and a '+ New Input' button. Below this is a text block describing the agent's function: 'You are a resume reviewer agent. You review CVs and enhance them to make them more industry-relevant. You generate a web query based on the updated resume to search for relevant jobs in that location. Finally using a web scraper you go through the links provided by Google and create a list of companies that a candidate can apply to. Here is the candidate's @CV'. The right part shows the 'Attributes' panel for the 'CV' input. It has a title 'Input' and a list of input types: Text, Number, True/False, Image, Audio, PDF / Document file, CSV / Text file, List, Object, and Select. The 'PDF / Document file' option is selected. Below the list, there's a 'Text' dropdown menu and a 'Long text' toggle switch.

3. **Using the PDF Parser Tool:** After selecting the PDF parser tool, go to the right-side panel under tool parameters. In the file section, click on the “variables” feature in the corner. Select “CV” to establish the file for parsing.

Extract and analyze content from PDF files.

3. **Adding Web Search Query:** For web search with EXA, type @ in the query section. In the pop-up, locate “query” under “query_generator” and select it.

5. Modifying Webscrape Loop: In the Webscrape loop, after changing the loop name, select “List” under loop type. In the corner, click on the “Variables” button. In the pop-up, locate “URL_Links” and select “Links.”

Select List

+ -

You will find it like this:

6. **Adding Webscrape Tool:** Add the webscrape tool, and in its right-side panel, click on the “variables” button at the top of the URL section. In the pop-up, select “item” under “Webscrape_loop.”

The rest of the steps remain the same. Follow the steps to build your agent.

Module: 3

Video 2: Damage Claim Chatbot (Part -2)

1. **Adding Flow:** Start by adding the “Damage claim chatbot” flow. Map the inputs to the appropriate type.
2. **Mapping Inputs in Chatbot Details Flow:** When calling the chatbot details flow, map each input to the correct variable by clicking on the variable button over each input and selecting the corresponding input from the list.

The rest of the steps remain the same.

Query: PDF Parser Missing in Wordware

Answer: You can now integrate PDFs directly into the LLM. Here's an example:

Additionally, you can refer to this link for issues related to the PDF parser: [PDF Parsing Guide](#). It includes updates on how to use the PDF parser effectively.

Please check the attached image—the system works fine even without the PDF parser. Whether the PDF is included or not, it functions correctly, especially when using `@variable` separately for user-uploaded CV PDFs.
